

**Amendments to the Specification:**

Please replace the title as shown on page 1 of the substitute specification filed with Applicants' response on December 21, 2004, with the following amended title:

**Strawberry Plant Named "~~Albion~~" 'Albion'**

Please replace current paragraph [15] (*i.e.*, as amended in Applicants' response filed December 21, 2004) with the following amended paragraph 15:

[0015] The fruit shape for 'Albion' can vary but is typically a long and symmetrical conic, and is easily distinguished from 'Aromas' (shortened and rounded conic) or 'Diamante' (rounded and occasionally flattened conic); 'Albion' usually has a greater proportion of symmetrical fruit than either comparison cultivar. External and internal fruit color for 'Albion' is darker than for 'Diamante' and slightly lighter than for 'Aromas' with substantially greater red color (Table 3). Achenes vary from yellow to dark red (Table 3), and are even with the fruit surface or slightly indented. The mean number of achenes per berry is 440.8 (range of 330-548). The average berry weight is 33 grams (Table 4). The adherence of the calyx to the fruit is medium. The hollow portion [[f]] of the fruit interior generally ranges from about 0-15%, subjectively, and is variable with culture and season.

Please replace Table 3 with the replacement version of Table 3 attached hereto (Attachment 1). Also attached is a marked-up copy showing the changes to Table 3 (Attachment 2).
